Stopline - reference diagrams

Companion to `stopline-spec.md` (spec v2.0, 3 Nov 2026). The Markdown spec is the source of truth; each figure's Mermaid source is embedded in the spec next to its reference. If a diagram here disagrees with the spec text, the spec text wins.

Figure	Title	Spec section	Page
1	Architecture	7.1 Architecture	2
2	Part lifecycle	8 Part lifecycle	3
3	End-of-turn check flow	7.2 What happens at the end of an agent turn	4
4	Feature matching decision	11.1 Matching algorithm	5
5	Hook interaction across one session (Claude Code)	12.1 Claude Code; Appendix A	6

Figure 1. Architecture

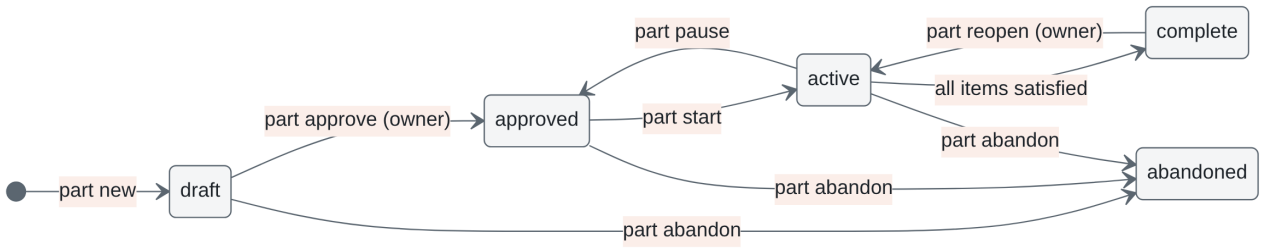

Referenced in spec section 7.1 Architecture.

Components and data stores. Everything inside Stopline runs locally; no server, no network access.

Figure 2. Part lifecycle

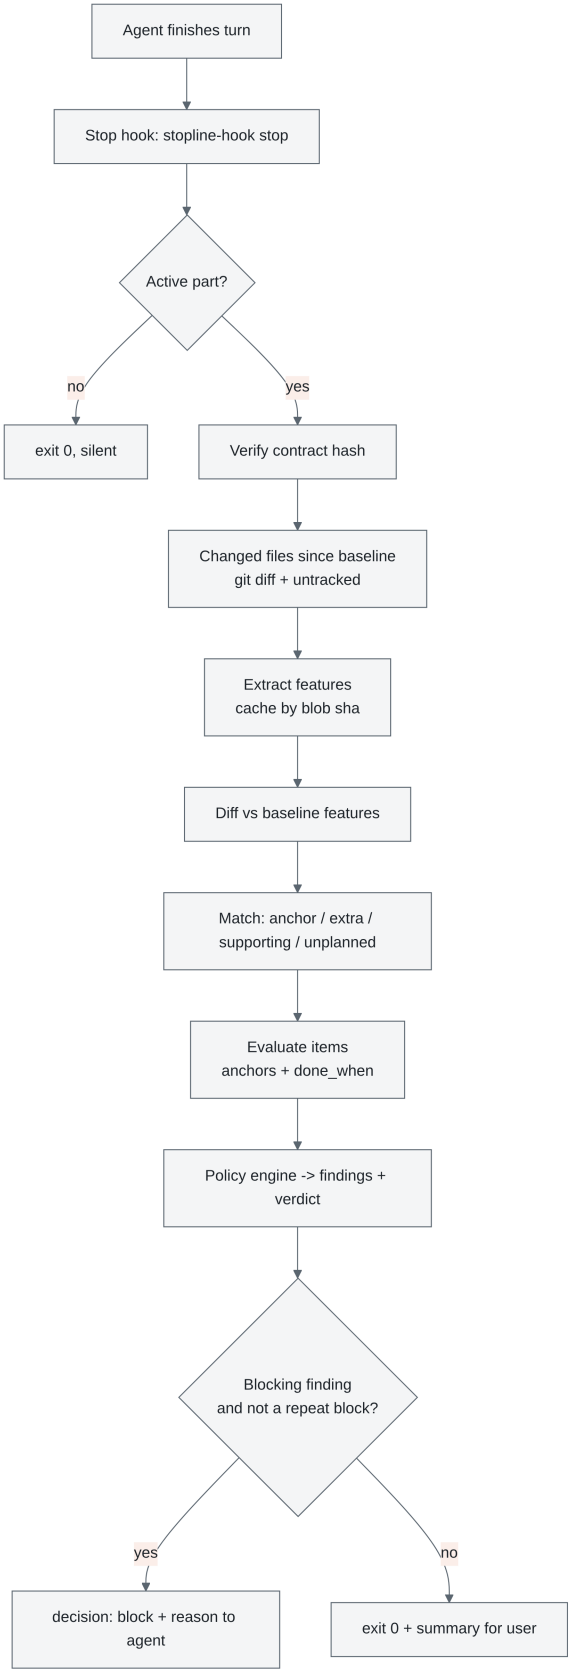

Referenced in spec section 8 Part lifecycle.

Part states and the commands or events that move between them. Owner-only transitions need an interactive terminal.

Figure 3. End-of-turn check flow

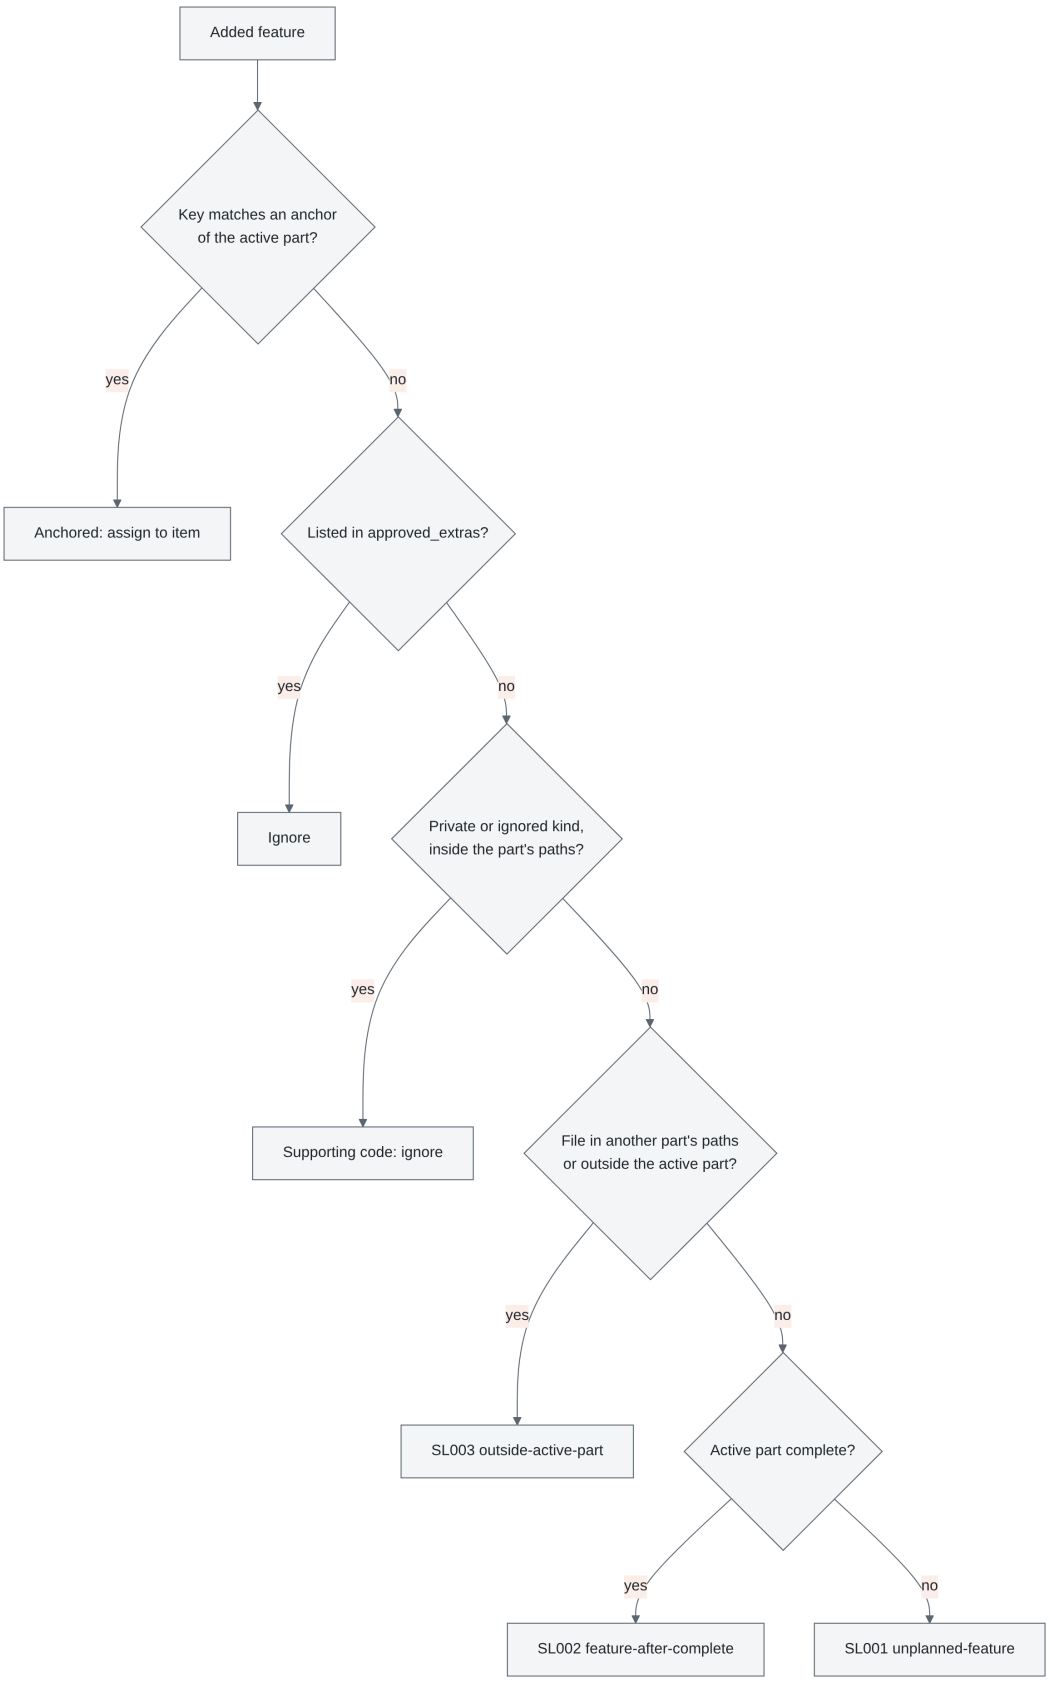

Referenced in spec section 7.2 What happens at the end of an agent turn.

The full check run by the Stop hook and by stopline check.

Figure 4. Feature matching decision

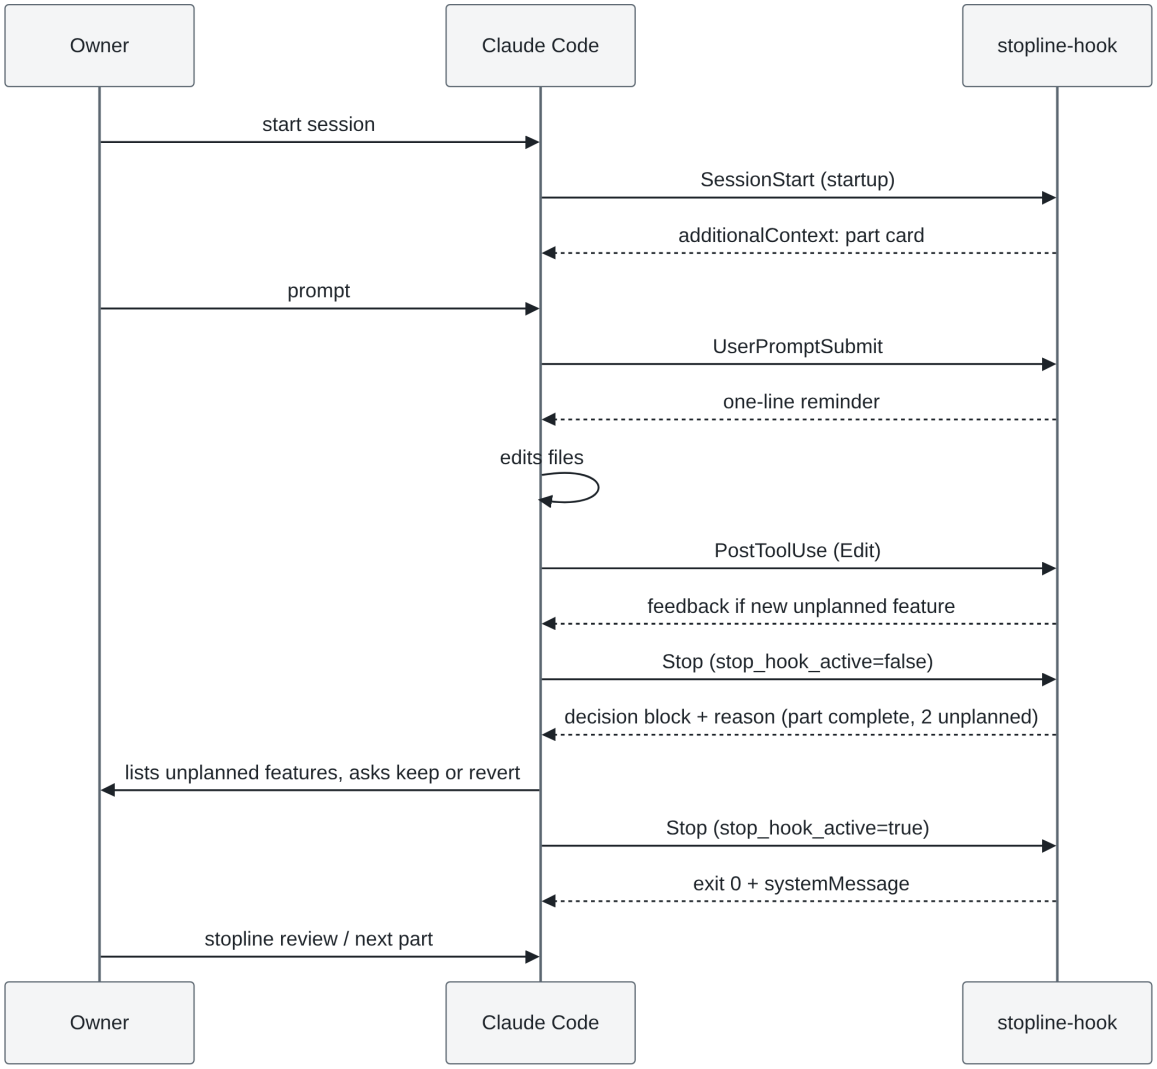

Referenced in spec section 11.1 Matching algorithm.

How each added feature is classified. First match wins.

Figure 5. Hook interaction across one session (Claude Code)

Referenced in spec section 12.1 Claude Code; Appendix A.

Which hook fires when, and what Stopline returns, including loop protection on the second stop.
